

Activity Diagrams

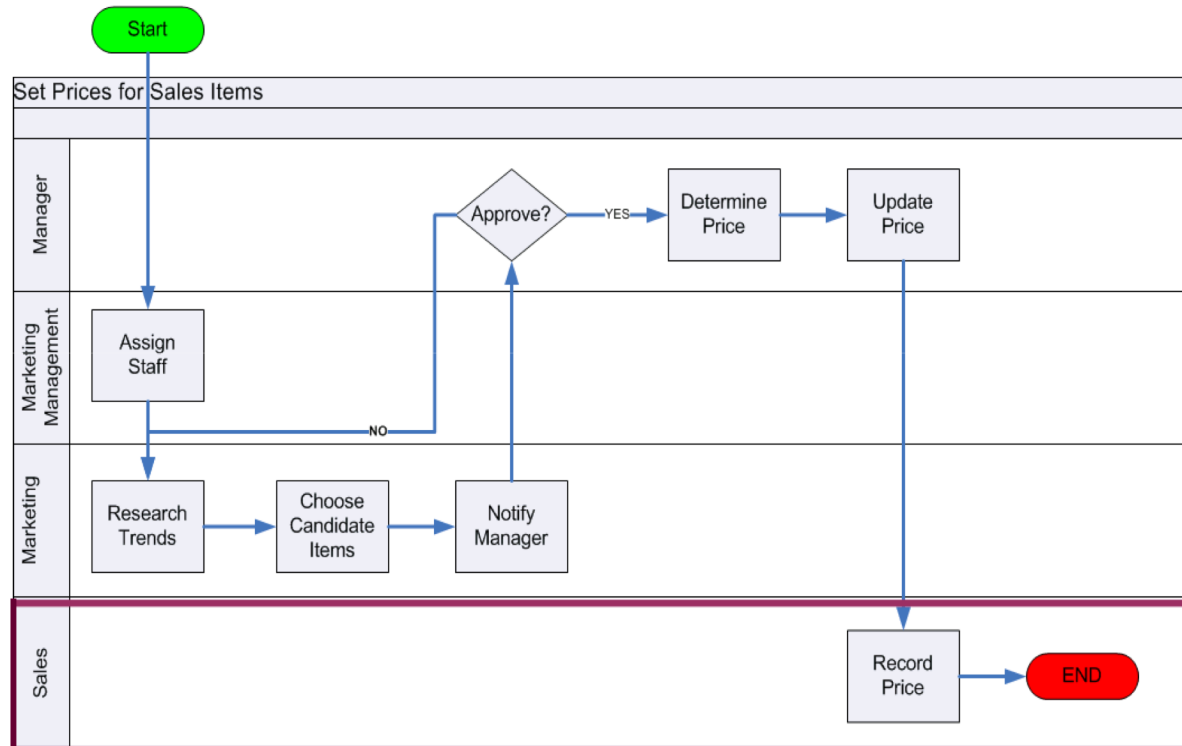

CSCI-4448 - Boese

University of Colorado **Boulder**

Overview

Activity Diagrams

Activity Diagrams - Definition

Activity Diagrams

- A.k.a. Business Process Mapping (or Modeling)
- Defining ***current-state*** and ***future-state*** business processes
- Show business **workflow** in response to a business event
- Show the interactions between people and organizations.

Activity Diagrams - Why

- Why?
 - Primary: Identify opportunities for business improvement and optimize business processes.
A key tool for Six Sigma and Lean approaches for business process improvement
 - Secondary:
Illustrate interactions between people and systems
 - Helps determine scope
 - Most people “get-it”. Easy to follow.
 - Helps for getting group consensus on what does happen or what should happen

Activity Diagrams – When Use

When should you use Activity Diagrams?

- Does your project have all of these characteristics?
 - The boundary includes direct interactions between people and optionally includes one or more systems,
 - Scope issues
 - *Stakeholders' understandings*
 - *The sequence in which activities occur is very important to scoping discussions right from the start of the project.*
 - Teams
 - *"Picture-thinkers"*
 - *Projects using Six-Sigma, Lean or other business modeling methodologies*

Details

Activity Diagrams

Activity Diagrams

- Represent the business processes, current and future states.
- Main Components

- **Swim lanes** with the actors

- **Initial Node**

- **Final Node**

- **Early Termination Node**

- **Activity:** *Rectangle (could have rounded edges)*

- **Flow:** *Directed lines*

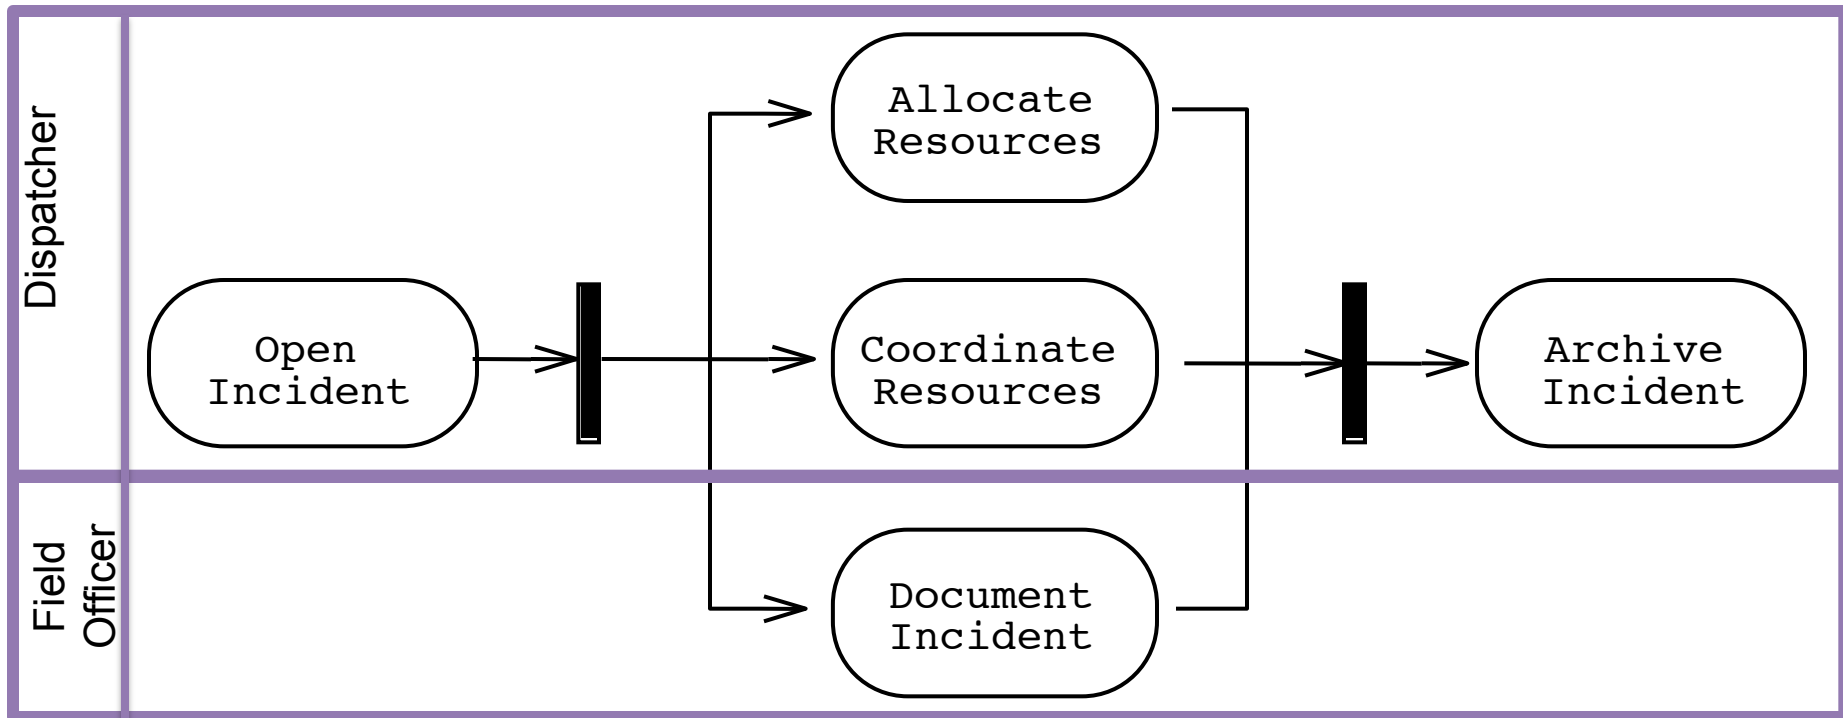

- **Fork/Join:** *Dotted box around activities that happen in parallel and bar to split/join flow*

- **Decision/Merge:** *Diamonds w/ conditional logic.*

Activity Diagrams: Grouping of Activities

- Activities grouped into **swim-lanes** to denote the object or subsystem that implements the activities.

Activity Diagrams - Components

- **Activity**

- Verb - Noun
- An action by a system or by a user.
- E.g.,
 - *Determine Price*
 - *Research Trends*
 - *Assign Staff*
 - *Update Profile*
 - *Create New User*

Research
Trends

Update
Price

Activity Diagrams - Components

- **Flow**

- Directed lines
- Lines between activities and/or other constructs.
- Flows can be annotated with guards “[student on list]” that restrict its use .

Activity Diagrams - Components

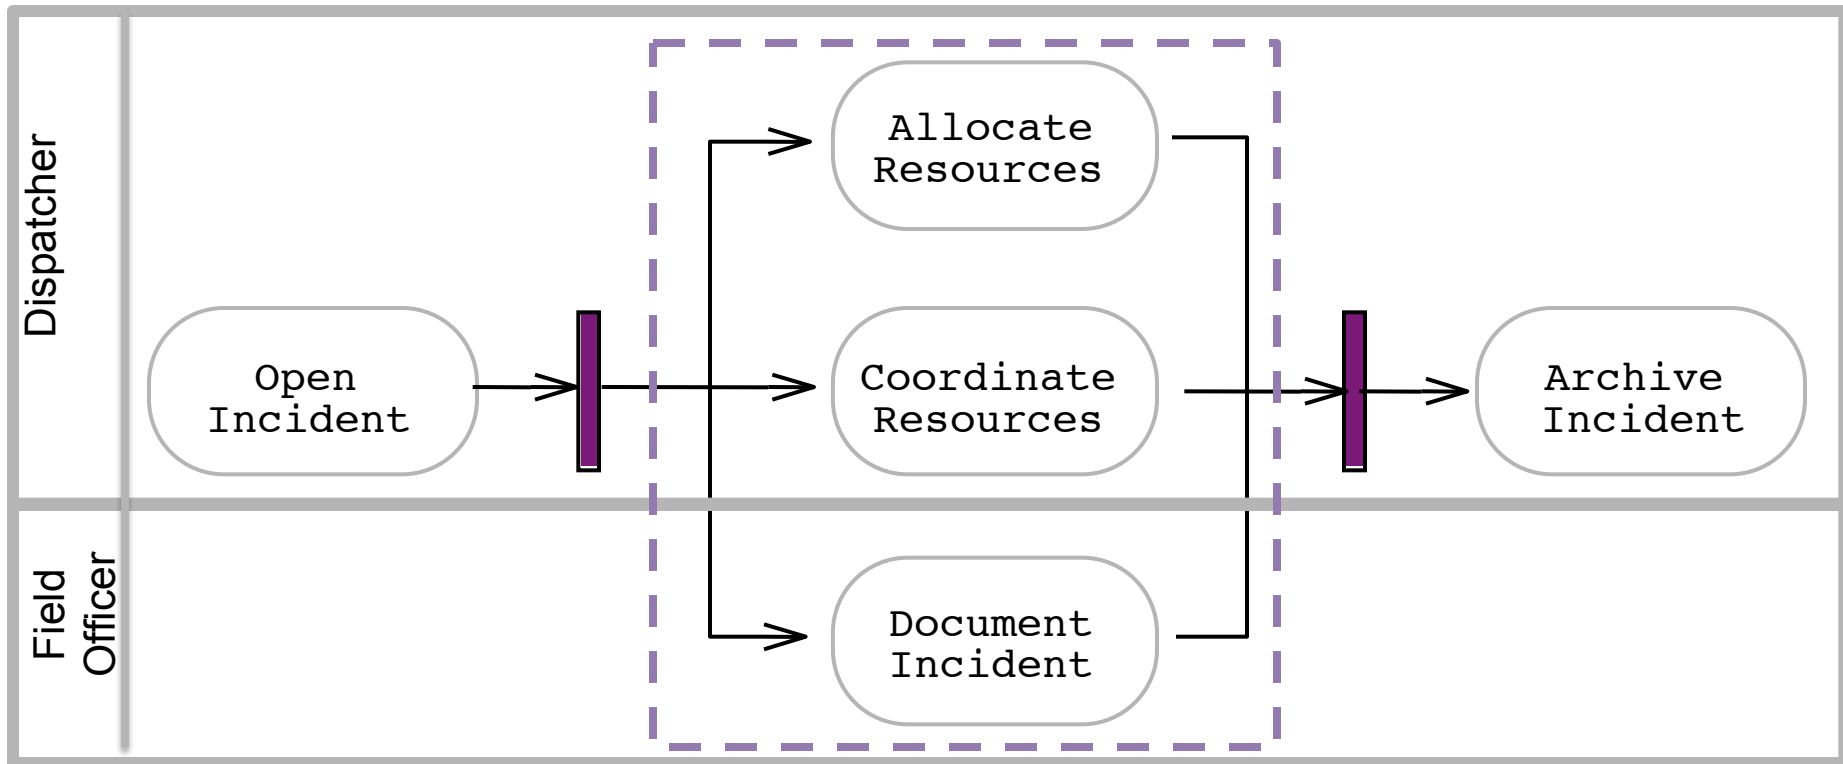

- **Decision**

- Diamond
- Condition
- Branches
 - *Yes/No*
 - *Qualifies/Does not qualify*
 - *Registered User/Guest.*

Fork/Join- Concurrency

- Dotted box around activities that happen concurrently.
- Bar to split/merge flow.

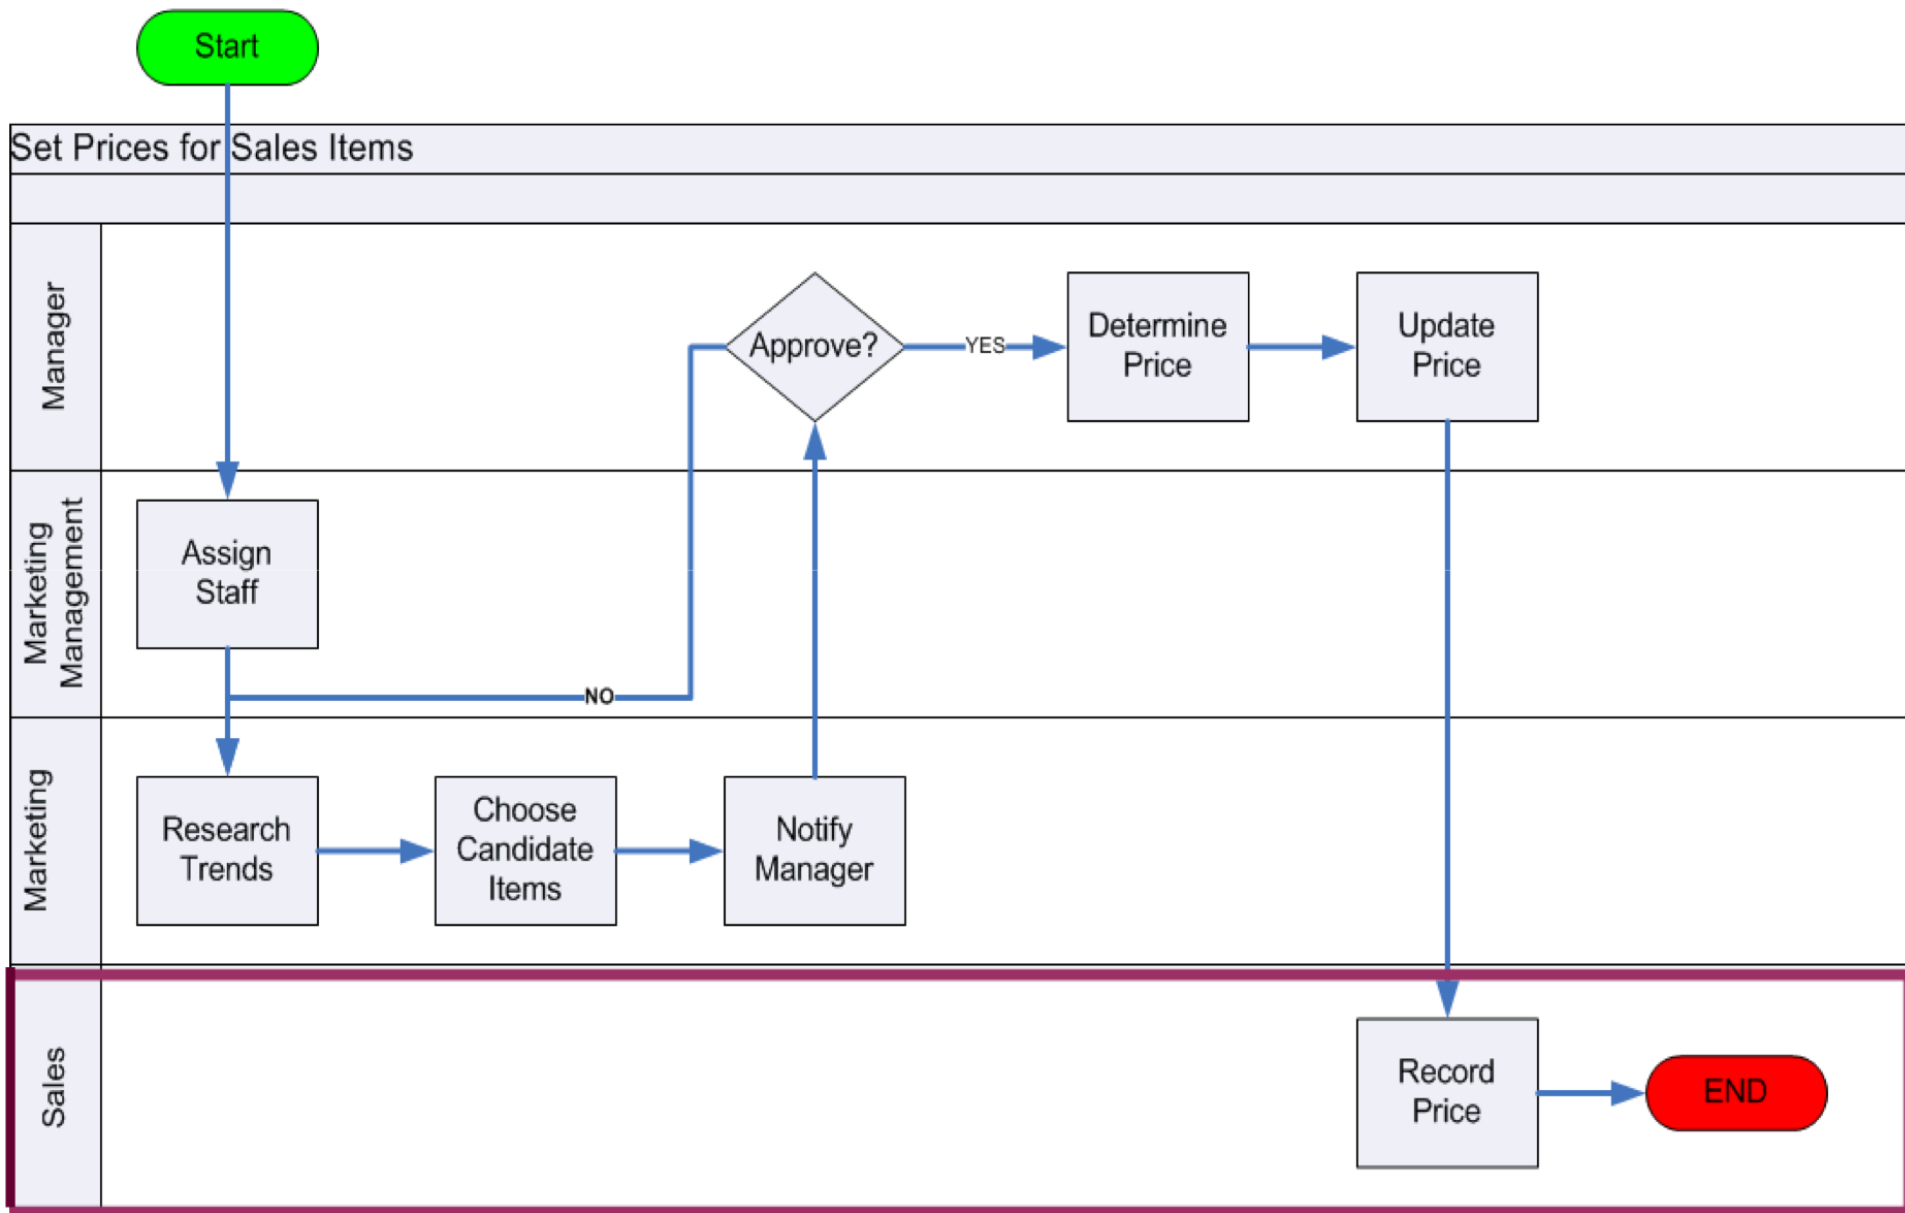

Activity Diagrams - How

Current State

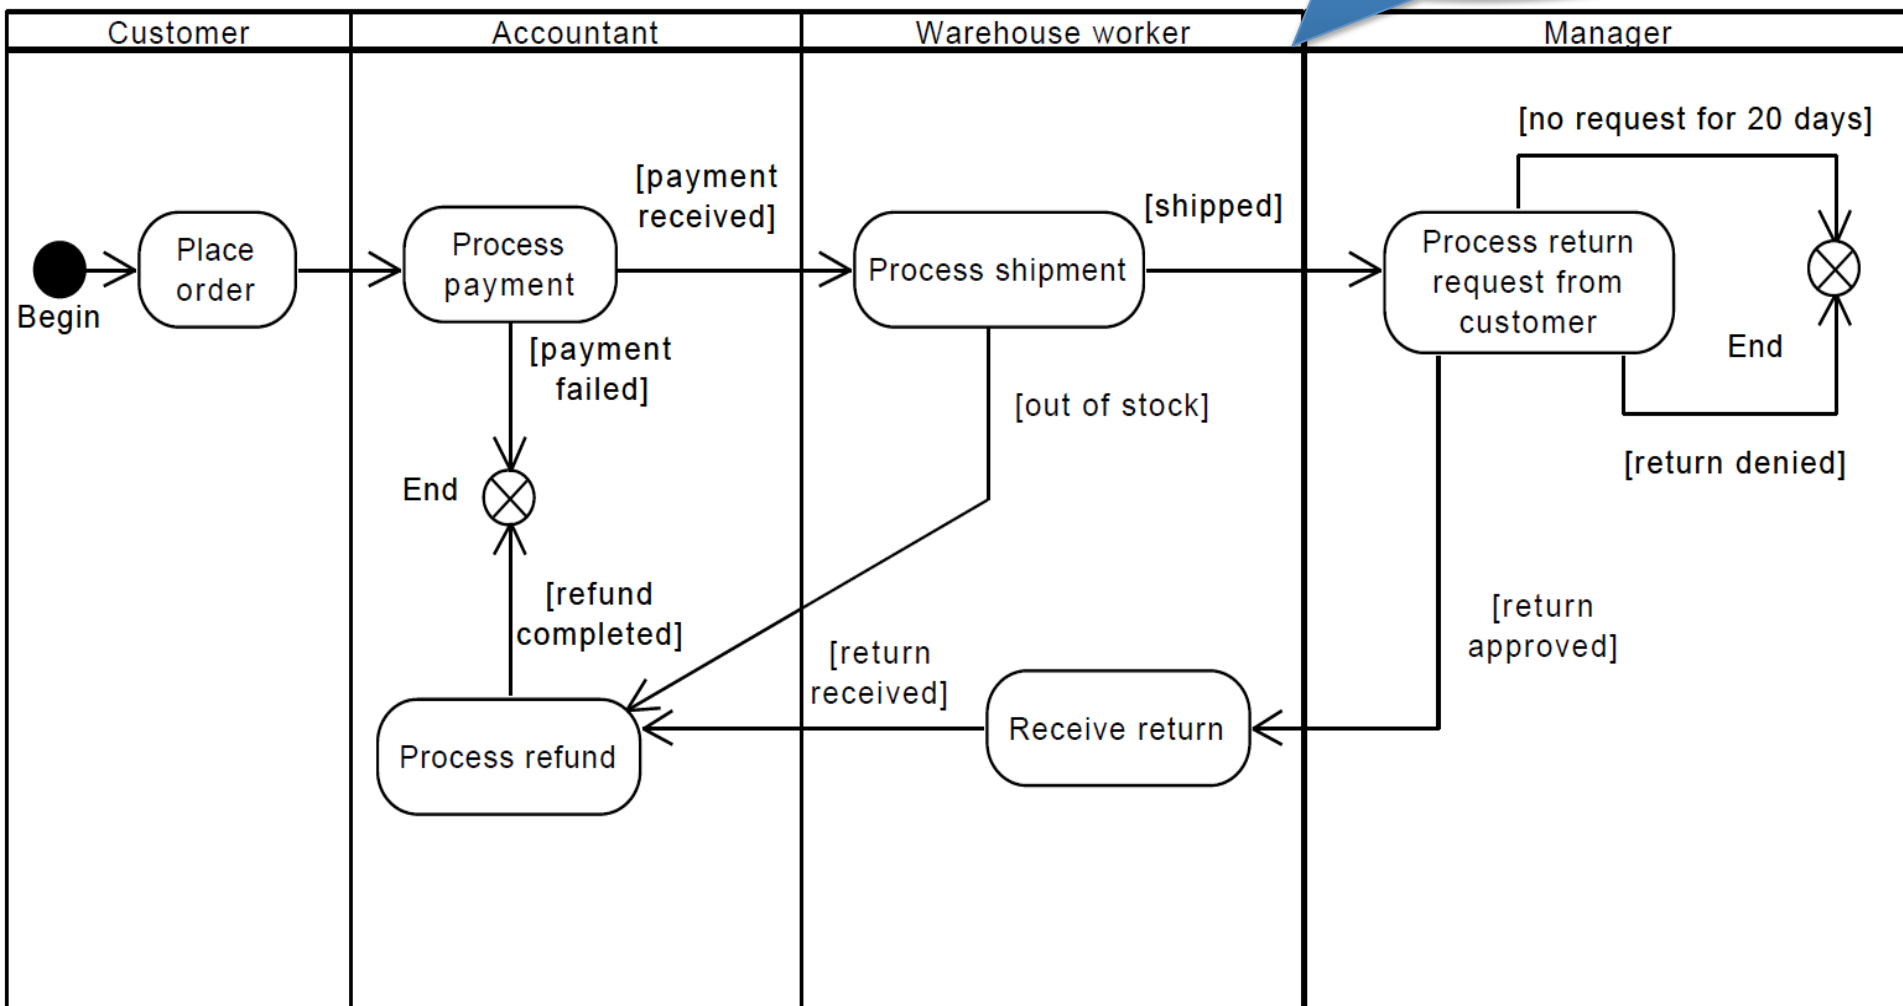

- **Name** the Diagram
- Identify and Define **Actors** (roles)
- Identify **steps** from beginning to end
 - Flag hotspots
 - Flag – but do not detail – business exceptions
- Determine how to handle **business exceptions**
- *If time permits, create a wish-list for reduction or removal of hotspots*

Future State

- Include system swim lane
- Optionally flag benefits of one or more steps (*instead of hotspots, which should – hopefully – be removed*)

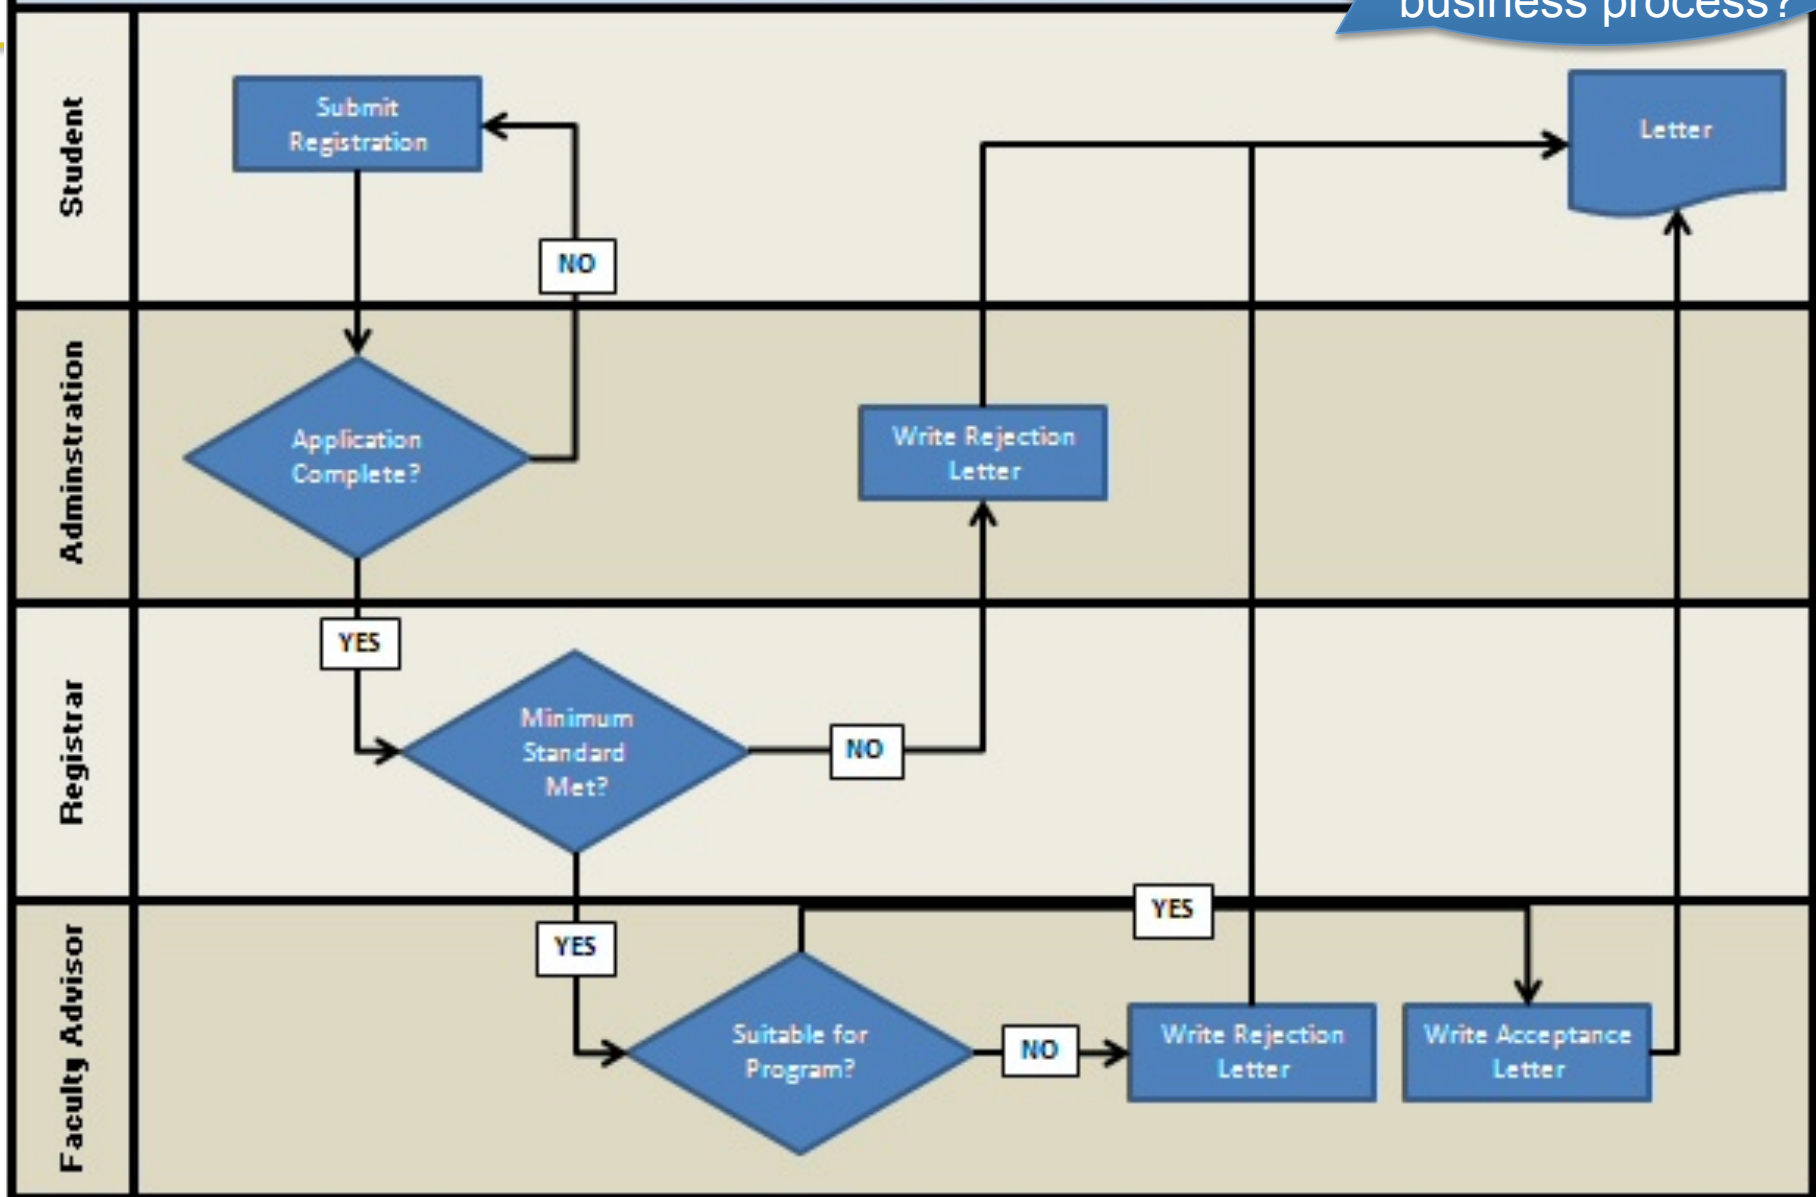

How might you improve this one?

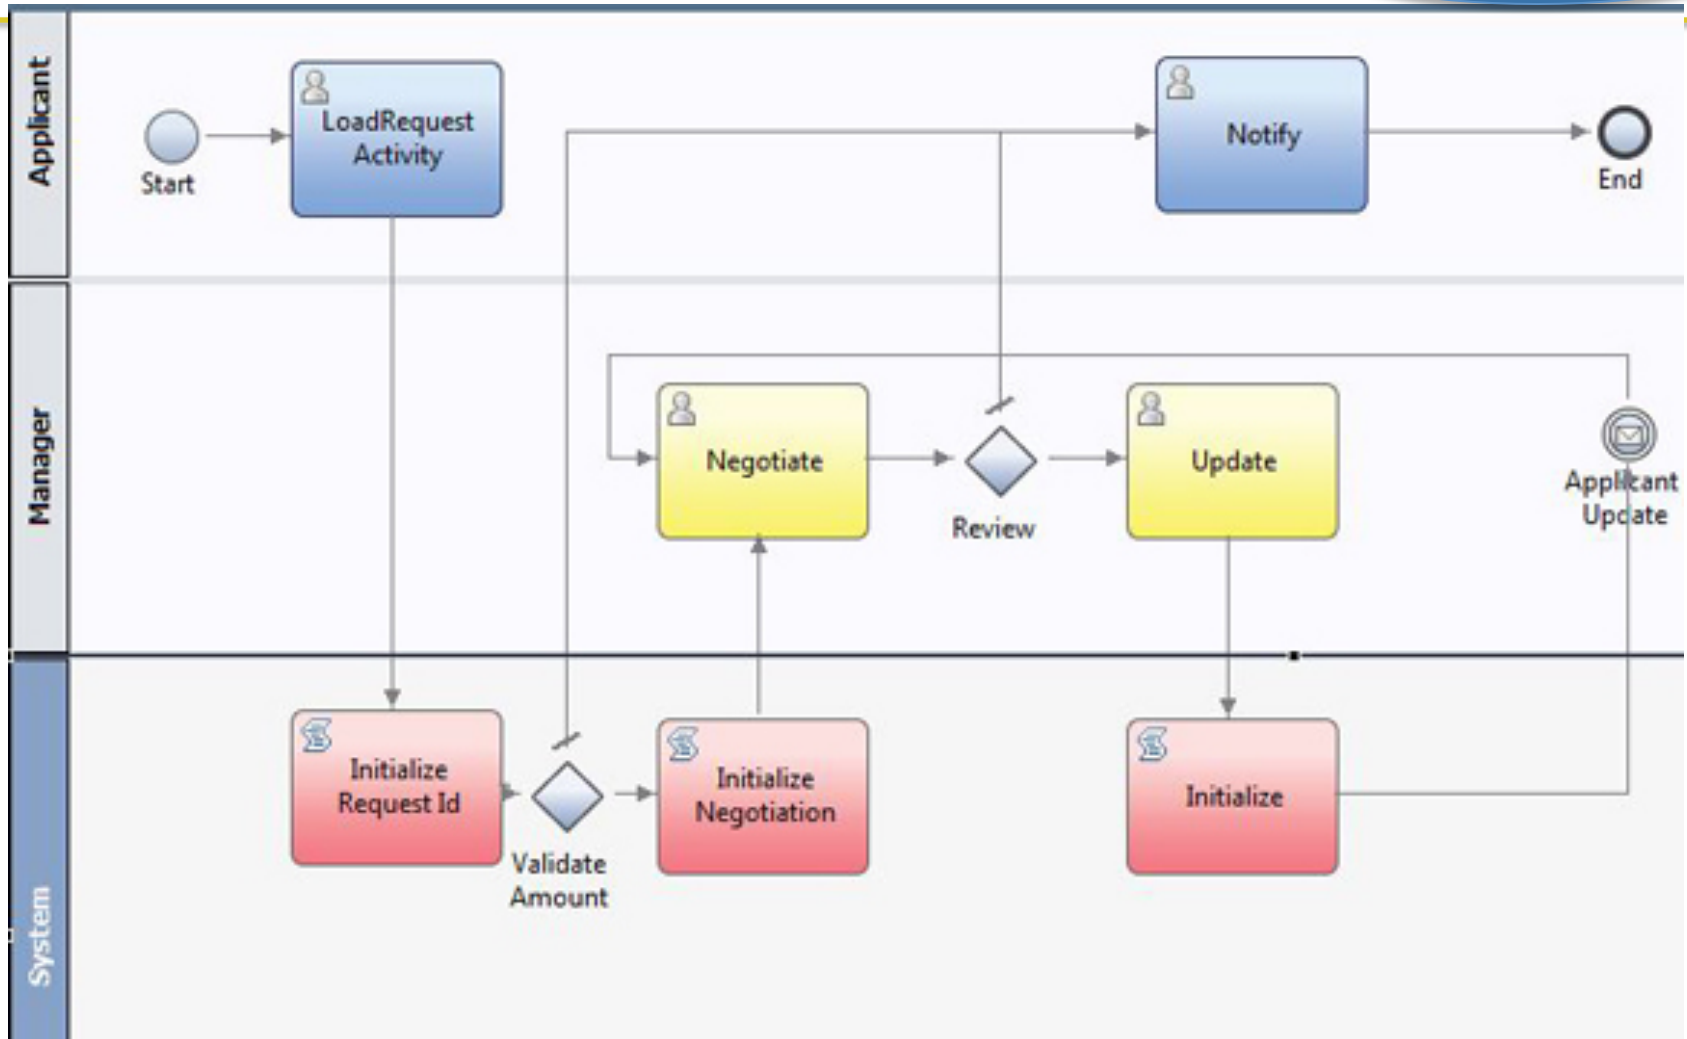

How could you improve the business process?

Student Registration - Before

Bad Example AD

What's not great about this?

Differences Between Diagrams

- Activity Diagrams are an important tool whenever business workflow is important
- Ultimately, use cases usually provide the authoritative view of the bunches of requirements, especially when their scope is automation of business activities.
- Which one or both?
 - Picture thinkers vs. text thinkers
 - May need both techniques for some teams, but try to avoid redundancy
 - When an activity diagram gets very detailed, it may be time to switch to text.
